

Lecture 11 : Parametric polymorphism  
+                    ↳ same code  
Data types            on  
                        different  
                        types

---

Ad-hoc polymorphism: same name  
for different code  
for different types

an int list is

( )

$x :: xs$ ,  $x : \text{int}$

$xs : \text{int list}$

→ and that's it!

a string list is

( )

$x :: xs$ ,  $x : \text{string}$

$xs : \text{string list}$

→ and that's it!

type variable

on ' $\alpha$  list is

( )

$x :: xs$  where  $x : \alpha$

$xs : \alpha \text{ list}$

→ and that's it!

$\alpha = \alpha$

$\beta = \beta$

Parametric polymorphism  
Save code for many shapes

---
